Junior software engineer trained at 42, where I worked close to the metal — memory management, Unix processes, network protocols, concurrency, and full-stack development. I've also shipped production software used by real users. Actively targeting backend and cybersecurity roles, with a particular interest in low-level security and pentesting.

Education

42 Network - Computer Science	2023 – Present
Fullstack development, backend engineering, systems programming, networking, operating systems, software architecture	
UPEC — Paris-Est Créteil University - BA International Business	2019 – 2022
Business administration, finance, international operations	
Université Paris-Dauphine - BSc Mathematics & Computer Science	2018 – 2019
Algorithms, data structures, statistics, databases	

Experience

Freelance — Software Developer & Tech Instructor - Paris, France	2024 – Present
• Built and shipped fullstack web applications in production (300+ active users), integrating REST APIs and Google Sheets backends. • Teaching coding and robotics to primary and middle school students, making technical concepts accessible to non-technical audiences.	
Restaurant Gloria — Floor Supervisor - Paris, France	2022 – 2023
Managed team operations in a high-pressure environment, strengthening execution and communication skills.	
VTI — International Business Officer - Casablanca, Morocco	2020 – 2021
Coordinated international operations and client relationships across Asia and Morocco.	

Projects

Webserv (C++ · team of 3) — HTTP/1.1 server in C++ from scratch — event-driven I/O with poll(), request parsing, routing, CGI support, and concurrent connections. No external libraries.	
ft_transcendence (TypeScript / Python · team of 3) — Full-stack web app built as a team — real-time multiplayer game, user authentication, WebSocket communication, and containerized deployment with Docker.	
Philosophers (C) — Solved the dining philosophers problem using threads and mutexes. Deep dive into concurrency, race conditions, and deadlock prevention.	
Minishell (C · team of 2) — Unix shell from scratch — pipes, redirections, signal handling, and process execution with fork/exec.	
Cub3D (C · team of 2) — Real-time raycasting engine with texture mapping, collision detection, and optimized low-level rendering. No engine abstraction.	
Inception (Docker) — Containerized infrastructure with NGINX, WordPress and MariaDB using Docker Compose on a virtual machine.	
Pipex (C) — Unix pipe behavior in C — chaining commands via pipes, managing file descriptors and child processes with fork/exec.	
Wedding Website (React / TypeScript) — Production fullstack app — real-time RSVP system, family group booking, admin dashboard, and Google Sheets backend. Used by 300+ guests.	

Skills

Systems	C, C++, Linux, sockets, memory management, multithreading
Backend	REST APIs, HTTP/1.1, event-driven architecture, CGI
Frontend	React, TypeScript, JavaScript, CSS, Vite, npm
Databases	SQL, data modeling
Tools	Git, Docker, CI/CD, Vercel
Security	Network fundamentals, pentesting basics, TryHackMe

Languages

French	Native
Arabic	Native
English	Professional
Spanish	C1
Italian	Beginner
